

## Product Fact Sheet

### The Bottom Line:

- Identifies opportunities for energy savings and configures PCs to realize those savings
- Provides centralized visibility and control over PC power settings
- Continuously monitors compliance with energy policies and automatically remediates when errors are found
- Reduces IT energy costs by up to \$60 per PC, per year
- Delivers a rapid and verifiable ROI, normally paying for itself in less than six months

# TRIUMFANT GREEN IT POWER MANAGEMENT

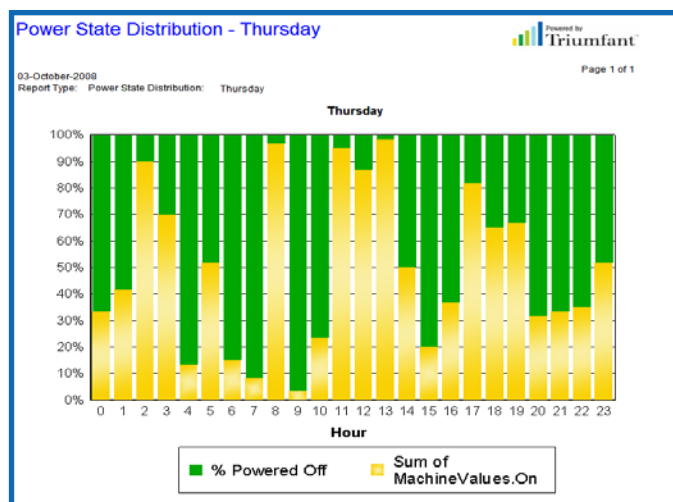

## Reduce Power Consumption without Impacting Use or Administration

Leaving a computer on outside of typical business hours can cost an organization between \$20 and \$60 per year. Yet scores of computers are left on around the clock within an average organization or government agency, incurring needless expense.

Triumfant Green IT Power Management is designed to provide an intelligent, highly automated and highly customizable mechanism for reducing power consumption. It delivers unsurpassed visibility and control without impacting computer use or impairing system management activities. The Triumfant solution continually checks to ensure that the power management settings for each computer are compliant with centrally managed power management policies and automatically remediates non-compliant settings when they are encountered. A comprehensive set of reports delivers unparalleled visibility into the organization's PC based power consumption and gives everyone from administrators to executives a clear view into the resulting energy savings.

### Product Benefits:

- Checks each computer continually to ensure that it conforms to power state policies and automatically remediates any machine found to be in non-compliance.
- Reduces electrical consumption and the associated CO2 emissions and utility expense.
- Simplifies deployment through a wizard-based interface.
- Provides extremely powerful and flexible control for tuning policies for large groups, smaller workgroups, or individual PC's.
- Comes out of the box with easily customizable power management policy templates.
- Enables sophisticated power shutdown procedures not available with competitive products that rely on scripts.
- Supplies effective, flexible and intelligent power management that balances power management policies and system management requirements, thereby maximizing power savings while providing the flexibility needed to maintain the IT infrastructure.
- Delivers extensive reporting to provide critical insight to power management activities from the machine level to executive summary views.
- Interfaces with other System Management tools so that power management issues can be automatically included into trouble ticketing process.

## Product Fact Sheet

### Complete Visibility into the State of Your Power Management

#### Sample reports:

**Power Savings** – estimates the savings resulting from implementing power management policies

**Power State Distribution** – the percent of computers in various power states over selected time intervals

**Compliance By Machine** – shows which computers are compliant with power management policies

**Compliance Exceptions by Machine** – shows the exceptions found that make a given machine non-compliant with power management policies

**Known Errors Over Time** – trend analysis of known errors related to power management

# TRIUMFANT GREEN IT POWER MANAGEMENT

Unlike expensive single-point solution power management products with limited functionality and complex command line interfaces, Triumphant Green IT Power Management leverages the powerful Triumphant platform to proactively collect, analyze, adjust, and report on computer state information. This platform gives the Triumphant solution a number of subtle but important advantages that set it apart.

### Product Advantages:

- Automated remediation reduces human interaction – and therefore administrative resources - while ensuring that power management policies are enforced.
- Administrators can use the included policy templates, modify these templates, or easily create their own using a graphical user interface, with a span of control that ranges from large groups of machines to the individual PC level. Administrators can utilize on-demand power state controls via a web-based interface to handle one-off situations.
- Triumphant reduces power consumption without imposing an administrative burden and without interfering with the IT maintenance procedures common to any organization. The flexibility of the solution allows it to maximize power savings while ensuring that machines are available for planned and unplanned maintenance activities.
- The Triumphant implementation allows for much more sophisticated, graceful and reliable shutdown procedure to ensure preservation of open files during the shutdown process, avoiding data loss and eliminating the potential for lost work.
- A Wake-on-LAN feature that allows a group of computers to be automatically transitioned from a hibernating, stand by, or shut down state to a ready state, preparing the computers for the work day. Wake-up tasks can be easily edited to change execution frequency, execution date/time, and target computers.
- Triumphant automatically determines the appropriate computer to serve as the proxy machine for the Wake-on-LAN capability and automatically configures the machine to ensure it remains powered on to implement the wake up process. Other tools require manual intervention for this process.
- An actionable view into power management that is unprecedented in the industry made possible with a wide range of standard reports, a user interface to create custom reports, the ability to distribute reports to executives and stakeholders, and the power to export reports to integrate the information into business documents.
- Available interfaces with other System Management systems enable power management issues to be automatically reported as trouble tickets and ensure that computers can automatically receive the proper power management policies when they are added to a workgroup or moved to a different workgroup.
- Triumphant Green IT Power Management leverages all of the native power management settings available in Windows Vista, and has devised a set of registry keys to represent power management settings for Windows XP.

### About Triumphant

Triumphant offers unique analysis software that automatically discovers, diagnoses and remediates unexpected changes and conditions on endpoint computers and servers, ensuring that these computers are secure, compliant, audit ready, properly configured and ready for business. Triumphant scans every computer every day, helping organizations to minimize security risks, reduce IT support costs, ensure compliance and increase quality of service. To learn more about how Triumphant can help your organization, please call us at 800.267.2190 or visit us at [www.triumphant.com](http://www.triumphant.com).
